[http://www.wrh.noaa.gov/sto/brief/www\\_bc\\_cal.php](http://www.wrh.noaa.gov/sto/brief/www_bc_cal.php)

# **WEATHER SYNOPSIS BY REGION**

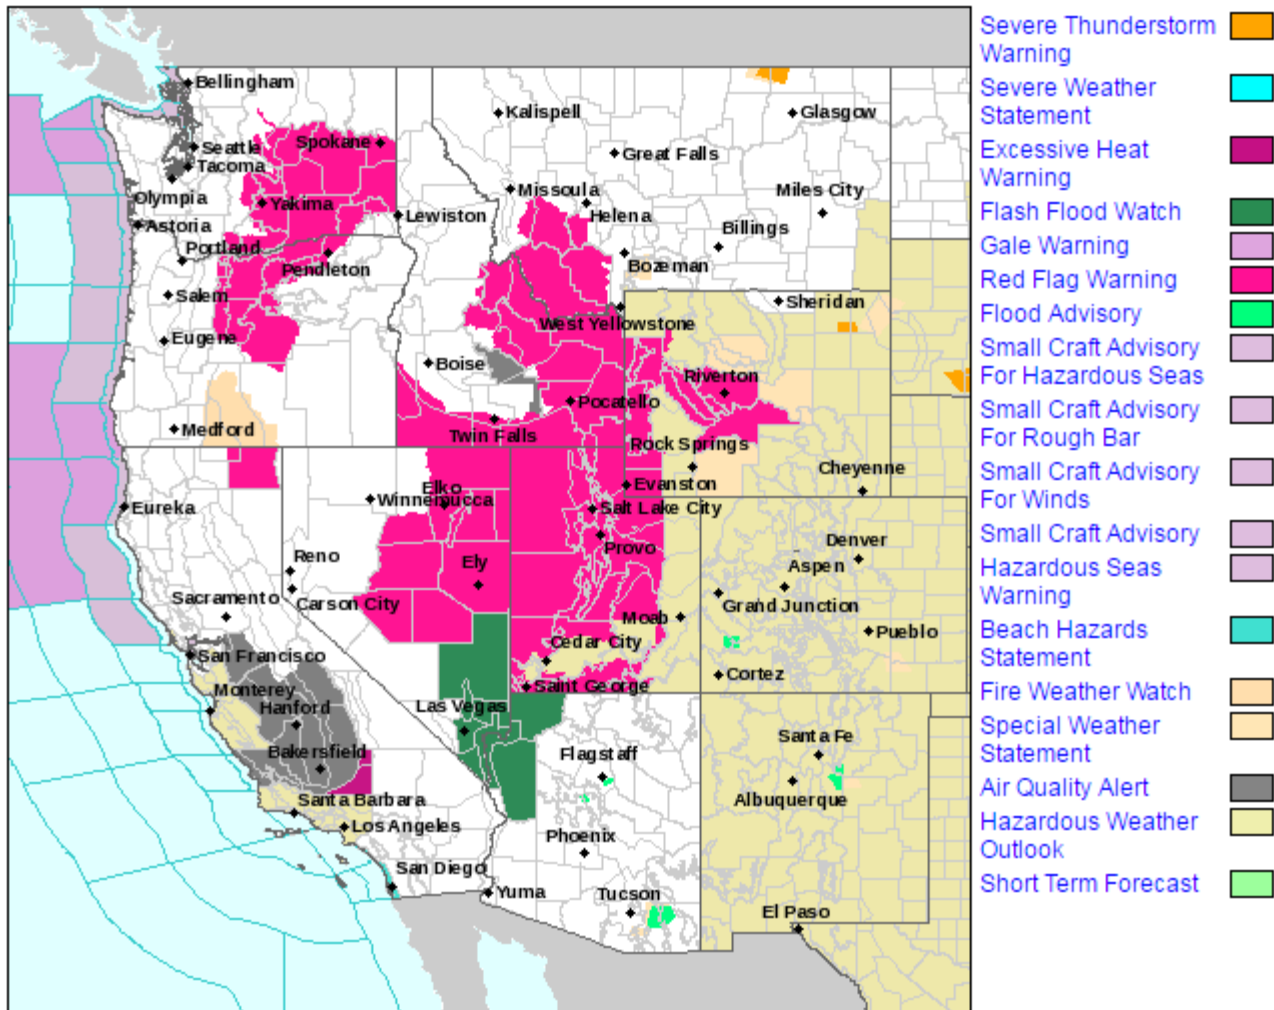

## **NORTHERN CALIFORNIA**

The high pressure responsible for the current heat wave will weaken and drift south as a low pressure trough over the Pacific Northwest deepens and pushes south over Northern California this weekend. Monsoon moisture produced nearly 70 lightning strikes in the Northern California Thursday and Friday, but the developing southeast winds associated with the trough has pushed most of the moisture off to the east. Only isolated thunderstorms are possible near the northern and eastern edges of the region this afternoon, and it's likely that no strikes will occur within Northern California boundary this afternoon. Temperatures will cool to 4-8 degrees above normal and minimum RH will be 8-18% in inland areas today. Many inland areas will continue to see humidity only recover to 25-40% overnight. Southwest to West winds east of the Cascade-Sierra crest will increase to 10-15 mph with gusts to 25 mph, and locally higher, this afternoon. Beginning Sunday temperatures will be closer to normal, but low humidity will continue in inland areas both during the day and at night. The marine layer is likely to deepen early in the week and afternoon sea breeze winds will be stronger and reach farther inland. Afternoon Southwest to West winds will increase to 10-20 mph with gusts to 30-35 mph Sunday, and further increase Monday and Tuesday with gusts to 35-40 mph. Minimum humidity in these areas will be 7-15% each day. In the East Side PSA (NC08) these winds will be on top of areas where scattered lightning strikes occurred Thursday and Friday, where holdover ignitions may exist and this situation is considered a High Risk for significant fire development. The dry and breezy conditions in Northeast California and Northern Sierra PSAs will fall just below High Risk criteria Sunday through Tuesday.

## **SOUTHERN CALIFORNIA**

Southeast flow aloft will bring isolated to scattered showers and thunderstorms to the Sierra through Monday and to the mountains and deserts of Southern California mainly east of the I-15 Corridor through Wednesday. By late next week, dry southwest flow aloft will end the shower and thunderstorm threat across most of the region. However, isolated to scattered showers and thunderstorms will continue near the Colorado River through the end of next week. High pressure over the southern half of the United States will weaken this weekend causing temperatures to cool to a little above normal by Sunday. Maximum temperatures will be in the mid 80s to mid 90s across the mountains and in the mid 90s to 105 in the valleys today. There will be little change in temperature Monday through Wednesday. Minimum humidity will be mainly between 15% and 30% away from the coast through Monday. There will be little change in humidity across Southern California next week, but by Tuesday minimum humidity will drop into the single digits and teens across Central California. A weak Pacific trough will cool temperatures to near or a little below normal by late next week.
